About the prototype, These are some of the extensions which we can do

1. In-person should be included as a consulting type. That should be the primary consult type for injury.

2. We should include a survey that asks about the injury and the following match information. And we should display appointment information based on need. If the survey suggests someone is in urgent need, we will display appointments within a day. Otherwise, we would not display immediate appointments. (To show that we have learned something from our interviews.)

3. Do we need to include all those types of doctors since this is an app for athletes?

4. Maybe we should include a page for athletes to rate the doctor after consulting.

5. As per the ethnography test, we need to make Cross-platform apps as the users required it. Nowadays, everyone prefers apps over a website
